WHAT IS CLAIMED IS:

- 1. A method of monitoring a power distribution system, said method comprising increasing a sampling rate for sampling analog monitoring signals from monitoring of said power distribution system until said sampling rate is high enough to capture high-speed transients.
- 2. The method of claim 1, further comprising monitoring both current and voltage parameters within lines of said power distribution system to generate said analog monitoring signals.
 - 3. The method of claim 1, further comprising: storing sampled data from said monitoring signals in a memory unit; and analyzing said stored data with a processor.
- 4. The method of claim 3, further comprising displaying sampled data, including detected high-speed transients, or data derived from said sampled data on a monitor.
- 5. The method of claim 3, further comprising interrupting a flow of power on said power distribution system if analysis of said stored data indicates a danger according to pre-defined parameters.
- 6. The method of claim 1, wherein said increasing said sampling rate further comprises increasing said sampling rate in response to user input from a user input device.
- 7. The method of claim 1, wherein said increasing said sampling rate further comprises automatically increasing said sampling rate as part of a monitoring routine for said power distribution system.

- 8. The method of claim 1, wherein said increasing a sampling rate for sampling analog monitoring signals from monitoring of said power distribution system further comprises taking every other sample from a particular line of said power distribution system.
- 9. The method of claim 8, further comprising sampling said monitoring signals by multiplexing said monitoring signals to an analog-to-digital converter; wherein said increasing said sampling rate comprises controlling multiplexing of said monitoring signals to provide a single monitoring signal to said analog-to-digital converter for an extended time such that a sampling rate for that monitoring signal is increased high enough to capture high-speed transients in that monitoring signal.
- 10. The method of claim 1, wherein said increasing said sampling rate further comprises controlling a sampling rate of one or more analog-to-digital converters, where each of said one or more analog-to-digital converters has a variable sample rate.

11. A system for monitoring a power distribution line, said system comprising: connections for individual lines in said power distribution line for providing monitoring signals indicative of current and voltage within the lines of said power distribution line;

at least one analog-to-digital converter for sampling said monitoring signals, said converter sampling a monitoring signal fast enough to capture high-speed transients.

12. The system of claim 11, further comprising:

a multiplexer for multiplexing said monitoring signals to said analog-to-digital converter; and

a processor controlling said multiplexer, wherein said processor causes said multiplexer to provide a particular monitoring signal to said analog-to-digital converter long enough for said analog-to-digital converter to capture high-speed transients in said particular monitoring signal.

- 13. The system of claim 12, further comprising a user input device connected to said processor, wherein said processor controls said multiplexer in accordance with user input from said user input device.
 - 14. The system of claim 11, wherein:

said at least one analog-to-digital converter comprises an array of analog-to-digital converters, each receiving a particular monitoring signal; said analog-to-digital converters each having a variable sampling rate; and

said system further comprises a processor for controlling a sampling rate of said analog-to-digital converters to at least periodically increase said sampling rate enough to capture high-speed transients.

- 15. The system of claim 14, further comprising a user input device connected to said processor, wherein said processor controls said array of analog-to-digital converters in accordance with user input from said user input device.
- 16. The system of claim 11, further comprising an interrupt device for selectively halting power flow in said power distribution system.
- 17. A system for monitoring a power distribution system, said system comprising: sampling means for sampling analog monitoring signals from monitoring of said power distribution system; and

means for selectively increasing a sampling rate of said sampling means until said sampling rate is high enough to capture high-speed transients.

18. The system of claim 17, further comprising: means for storing sampled data from said monitoring signals in a memory unit; and means for analyzing said stored data with a processor.

- 19. The system of claim 17, further comprising means for interrupting a flow of power on said power distribution system if analysis of said stored data indicates a danger according to pre-defined parameters.
- 20. The system of claim 17, further comprising user input means for controlling said means for increasing said sampling rate.
- 21. The system of claim 17, wherein said sampling means further comprise means for multiplexing said monitoring signals to an analog-to-digital converter.
- 22. The system of claim 21, wherein said means for multiplexing said monitoring signals are controlled by control means to provide a single monitoring signal to said analog-to-digital converter for an extended time such that a sampling rate for that monitoring signal is increased high enough to capture high-speed transients in that monitoring signal.
- 23. The system of claim 17, wherein said means for increasing said sampling rate further comprises means for controlling a sampling rate of one or more analog-to-digital converters receiving said monitoring signals, where each of said one or more analog-to-digital converters has a variable sample rate.
